CLAIMS

In a directory server containing heterogeneous directory entries, a
method of hierarchically navigating said entries comprising the steps of:
creating one or more directory views;

organizing said directory views into a hierarchy using information concerning said entries; and

using one of said directory views that is most appropriate for navigating to said entries.

- 2. The method of Claim 1, wherein said entries do not need to be physically in any particular place.
- The method of Claim 1, wherein said directory server may have a flat directory information tree.
- 4. The method of Claim 1, wherein the existence of said directory views is transparent to a client of said directory server and said client is not required to have special knowledge of said directory views to use them.
- 5. The method of Claim 1, wherein each of said directory views begins with an ordinary entry.

- 6. The method of Claim 1, wherein each of said directory views belongs to a specific object class that contains a filter attribute, said filter attribute containing a filter that describes said views.
- 7. The method of Claim 6, wherein said filter attribute is omitted from said views to facilitate a hierarchical directory structure.
 - 8. The method of Claim 1, wherein each of said directory views comprises sub-views which provide a subset of said views.
 - 9. The method of Claim 8, wherein said sub-views comprises different subject domains from said directory views.
- 10. In a directory server containing directory entries and a directory views hierarchy, each view containing a filter describing said view, a method of searching said view in said directory views hierarchy with a given filter, comprising the steps of:

rewriting said given filter to be a sub-tree search of the parent of the top most view in said view hierarchy; and

performing said sub-tree search with said rewritten filter.

- 11. The method of Claim 10, wherein said directory entries do not need to be physically in any particular place.
- 12. The method of Claim 10, wherein said directory server has a flat directory information tree.
- 13. The method of Claim 10, wherein the existence of said views is transparent to a client of said directory server and said client requires no special knowledge of said views to use them.
 - 14. The method of Claim 10, wherein each of said directory views begins with an ordinary entry.
- 15. The method of Claim 10, wherein each of said directory views belongs to a specific object class that contains a filter attribute, said filter attribute containing a filter that describes said directory views.
 - 16. The method of Claim 10, wherein said filter attribute is omitted from said directory views to facilitate a hierarchical directory structure.
- 15 17. The method of Claim 10, wherein each of said directory views comprises sub-views which provide a subset of said views.

15

- 18. The method of Claim 17, wherein said sub-views comprise different subject domains from said directory views.
- 19. The method of Claim 10, said rewriting step further comprising:
- (a) collecting filters from said view and all ancestor views of said view to form a first sub-filter;
 - (b) if the search is not a sub-tree search, collecting all filters from all descendent views to form a second sub-filter;
- (c) adding a third sub-filter to ensure all children of said view are included in the search for one level search or ensure all descendents of said view are included for a sub-tree search; and
- (d) combining said sub-filters from steps (a)-(c) and said given filter to produce said rewritten filter.
- 20. The method of Claim 19, wherein step (a) further comprising the steps of:
- starting from the top most view and working down;
 - (2) adding each filter to said first sub-filter in step (a) using the logical AND operator; and
 - (3) moving down said hierarchy and going to step (2) until at said view.

- 21. The method of Claim 19, wherein step (b) further comprising the steps of:
 - (1) working down said hierarchy until said hierarchy ends;
- (2) adding each filter to said second sub-filter in step (b) using the
 logical AND operator and the logical NOT operator; and
 - (3) repeating step (2) until all sub-views of said view have been accounted for.
 - 22. The method of Claim 19, wherein step (c) further comprising the steps of:
 - (1) for sub-tree searches, using the logical OR operator and a filter which includes the components of said descendent views' distinctive attributes, and which excludes the distinctive attribute of said view;
 - (2) for one level searches, using the logical OR operator and a filter which includes the components of said children views' distinctive attributes, and which excludes the relative distinctive attribute of all children views of said view using the logical NOT operator; and
 - (3) for base searches, using the filter "objectclass=nsview", wherein "nsview" is the object class of said views.

- 23. The method of Claim 19, wherein step (d) further comprising the steps of:
- (1) combining said third sub-filter from step (c) with the given search filter using the logical AND operator;
- (2) combining said first sub-filter from step (a) and said second sub-filter from step (b) with the given search filter using the logical AND operator;
- (3) combining the resulting filters from steps (1) and (2) using the logical operator OR.
- 24. The method of Claim 19, wherein said sub-filters from steps (a), (b) and (c) may be cached so that the filter rewriting only needs to perform step (d), which amounts to simple filter concatenation.
- 25. A directory server for managing heterogeneous directory information, comprising:
 - a plurality of directory entries; and
- a set of directory views to facilitate hierarchical navigation of said directory entries.
 - 26. The directory server of Claim 25, wherein said directory entries do not need to be physically in any particular place.

- 27. The directory server of Claim 25, further comprising:a flat directory information tree.
- 28. The directory server of Claim 27, further comprising:
 means to search said directory views by rewriting filters.
- 5 29. The directory server of Claim 25, wherein the existence of said directory views is transparent to a client of said directory server and said client is not required to have special knowledge of said directory views to use them.
 - 30. The directory server of Claim 25, wherein each of said directory views begins with an ordinary entry.
- 31. The directory server of Claim 25, wherein each of said directory views belongs to a specific object class that contains a filter attribute, said filter attribute containing a filter that describes said directory views.
 - 32. The directory server of Claim 25, wherein said filter attribute is omitted from said views to facilitate a hierarchical directory structure.

- 33. The directory server of Claim 25, wherein each of said directory views comprises sub-views that provide a subset of said directory views.
- 34. The directory server of Claim 33, wherein said sub-views comprise different subject domains from said directory views.
